

Requirements_Management

TOGAF ADM - Requirements Management

Purpose: Manage requirements throughout all ADM phases

Overview

Position in ADM

Key Activities

Requirements Repository

- Functional requirements
- Non-functional requirements (NFRs)
- Constraints
- Assumptions

ATTRIBUTES FOR EACH REQUIREMENT:

- ID (unique identifier)
- Description
- Source (who requested)
- Priority (High/Medium/Low)
- Status (New/Approved/Implemented/Rejected)
- Phase(s) addressed
- Traceability (which architecture elements address it)

Requirements by Phase

REQUIREMENTS BY PHASE

PHASE A (Vision):

- High-level business requirements
- Stakeholder concerns
- Business drivers

PHASE B (Business):

- Business process requirements
- Organizational requirements
- Business capability requirements

PHASE C (Data & Application):

- Data requirements
- Application functionality requirements
- Integration requirements

PHASE D (Technology):

- Infrastructure requirements
- Platform requirements
- Security requirements
- Performance requirements (NFRs)

PHASE E-F (Implementation):

- Implementation constraints
- Migration requirements
- Transition requirements

Traceability Matrix

Requirements Traceability Matrix			
Req ID	Requirement	Phase	Architecture Element
REQ-001	100ms response time	D	Redis caching, CDN
REQ-002	99.99% availability	D	Multi-AZ, Auto-scaling
REQ-003	Real-time analytics	C	Kafka, Streaming pipeline
REQ-004	Unified player view	C	Player 360 Platform
REQ-005	PCI-DSS compliance	D	Payment service isolation
REQ-006	Automated onboarding	B	Onboarding process redesign
REQ-007	Cloud-native	D	EKS, Kubernetes deployment

Handling Requirement Changes

Handling Requirement Changes
STEP 1: RECEIVE CHANGE REQUEST └─ New requirement or change to existing STEP 2: ASSESS IMPACT └─ Which phases are affected? └─ What architecture elements need to change? STEP 3: EVALUATE └─ Is this change justified? └─ What's the cost/benefit? STEP 4: DECIDE └─ Accept: Update requirements & architecture └─ Reject: Document reason └─ Defer: Schedule for future phase/cycle STEP 5: UPDATE └─ Update Requirements Repository └─ Update affected architecture documents └─ Communicate to stakeholders

Requirements vs Constraints vs Assumptions

REQUIREMENTS vs CONSTRAINTS vs ASSUMPTIONS	
REQUIREMENTS	What the system MUST do or achieve Example: "System must support 10,000 concurrent users"
CONSTRAINTS	Limitations that RESTRICT design choices Example: "Must use existing Oracle database" Example: "Budget limited to \$500K"
ASSUMPTIONS	Things we BELIEVE to be true but haven't verified Example: "IT team has Kubernetes expertise" Example: "Vendor API will remain stable"

Key Deliverables

Deliverable	Description
Requirements Repository	Central storage of all requirements
Traceability Matrix	Mapping requirements to architecture
Impact Assessments	Analysis of requirement changes
Requirements Sign-off	Stakeholder approval of requirements

Summary

REQUIREMENTS MANAGEMENT = "THE HUB OF ADM"

- NOT a phase – operates **THROUGHOUT** all phases
- Captures requirements from stakeholders
- Stores in central repository
- Manages changes
- Ensures requirements are addressed
- Maintains traceability

OUTPUT: Requirements Repository + Traceability Matrix

Without Requirements Management, architecture loses connection to what stakeholders actually need!
